

AMENDMENTS TO THE CLAIMS:

Please add Claims 92 through 95 as follows:

1 - 75. (Cancelled)

76. (Previously Presented) A data processing apparatus comprising:

a processing unit adapted to perform multiple processes;

an allocation unit adapted to allocate predetermined codes to predetermined processes of the multiple processes, and to allocate codes other than the predetermined codes to processes of the multiple processes other than the predetermined processes thereof;

a code input unit adapted to cause a user to input a code for performing a respective one of the processes;

a control unit adapted to control said processing unit so as to perform the process corresponding to the code input by said code input unit; and

an output unit adapted to output printing data, which indicates the codes allocated by said allocation unit, to a printer,

wherein in accordance with a print instruction being provided by a user, or in accordance with reaching of a time set in advance, said allocation unit allocates codes other than the predetermined codes to the processes of the multiple processes other than the predetermined processes thereof, and said output unit outputs the printing data, which indicates the codes allocated by said allocation unit, to the printer.

77. (Previously Presented) An apparatus according to claim 76, wherein the predetermined processes of the multiple processes include at least one of a sending and receiving process of electronic mail data and a World Wide Web browsing process.

78. (Previously Presented) An apparatus according to claim 76, further comprising a receiving unit adapted to receive a television signal, wherein the processes of the multiple processes other than the predetermined processes thereof include a recording scheduling process of each of a plurality of programs transmitted on the television signal.

79. (Previously Presented) An apparatus according to claim 78, further comprising a searching unit adapted to search a program on a plurality of programs transmitted on the television signal, in accordance with a predetermined search condition, wherein the processes of the multiple processes other than the predetermined processes thereof include a recording scheduling process of the program searched by said searching unit.

80 - 83. (Cancelled)

84. (Previously Presented) A data processing method for data processing apparatus having multiple functions, said method comprising the steps of:
a processing step of performing multiple processes;

an allocating step of allocating predetermined codes to predetermined processes of the multiple processes, and allocating codes other than the predetermined codes to processes of the multiple processes other than the predetermined processes thereof;

a code inputting step of causing a user to input a code for performing a respective one of the processes;

a control step of controlling said processing step so as to perform the process corresponding to the code input in said code inputting step; and

an outputting step of outputting printing data, which indicates the codes allocated in said allocating step, to a printer,

wherein in accordance with a print instruction being provided by a user, or in accordance with reaching of a time set in advance, said allocating step allocates codes other than the predetermined codes to the processes of the multiple processes other than the predetermined processes thereof, and said output step outputs the printing data, which indicates the codes allocated in said allocation step, to printing means.

85. (Previously Presented) A method according to claim 84, wherein the predetermined processes of the multiple processes include at least one of a sending and receiving process of electronic mail data and a World Wide Web browsing process.

86. (Previously Presented) A method according to claim 84, further comprising a receiving step of receiving a television signal, wherein the processes of the multiple processes

other than the predetermined processes thereof include a recording scheduling process of each of a plurality of programs transmitted on the television signal.

87. (Previously Presented) A method according to claim 86, further comprising a searching step of searching a program on a plurality of programs transmitted on the television signal, in accordance with a predetermined search condition, wherein the processes of the multiple processes other than the predetermined processes thereof include a recording scheduling process of the program searched in said searching step.

88 - 91. (Cancelled)

92. (New) A data processing apparatus comprising:

processing means adapted to perform multiple processes;

allocation means adapted to allocate predetermined codes to predetermined processes of the multiple processes, and to allocate codes other than the predetermined codes to processes of the multiple processes other than the predetermined processes thereof;

code input means adapted to cause a user to input a code for performing a respective one of the processes;

control means adapted to control said processing means so as to perform the process corresponding to the code input by said code input means; and

output means adapted to output printing data, which indicates the codes allocated by said allocation means, to a printer,

wherein in accordance with a print instruction being provided by a user, or in accordance with reaching of a time set in advance, said allocation means allocates codes other than the predetermined codes to the processes of the multiple processes other than the predetermined processes thereof, and said output means outputs the printing data, which indicates the codes allocated by said allocation means, to the printer.

93. (New) An apparatus according to claim 92, wherein the predetermined processes of the multiple processes include at least one of a sending and receiving process of electronic mail data and a World Wide Web browsing process.

94. (New) An apparatus according to claim 92, further comprising receiving means adapted to receive a television signal, wherein the processes of the multiple processes other than the predetermined processes thereof include a recording scheduling process of each of a plurality of programs transmitted on the television signal.

95. (New) An apparatus according to claim 94, further comprising searching means for searching a program on a plurality of programs transmitted on the television signal, in accordance with a predetermined search condition, wherein the processes of the multiple processes other than the predetermined processes thereof include a recording scheduling process of the program searched by said searching means.
